

ABSTRACT

There is provided a laser display device that is applicable to mobile equipment, which device prevents laser light from being applied to a region other than a screen.

A laser display device (100) is provided with a laser projection part (101) comprising at least one coherent light source and an optical system for converting light from the coherent light source into video, a screen (103) onto which the light emitted from the laser projection part (101) is projected, and an arm (102) that is attached to the screen (103) and supports the laser projection part (101), and the movable range and movable direction of the laser projection part (101) are limited by the arm (102) so that light from the laser projection part (101) is applied to only the screen (103).
